DETAILED ACTION

1. Claims 232-255 allowed.
2. The following is an examiner's statement of reasons for allowance:

Claim 232 recites a method of manufacturing a sensor comprised of the steps of providing a first organic material at a concentration "x" and a second organic material at a concentration "y" and a substrate with two preselected regions; contacting the first region with the first solution at a concentration "x+a"; contacting the second region with the first solution at a concentration; contacting the first region with the second solution at a concentration "y"; and contacting the second region with the second solution at a concentration "y+b". This results in a first region having a blend of the first organic material at mole fraction "m" and the second organic material at mole fraction 1-"m" and a second region having a blend of the first material at mole fraction "n" and second organic material at mole fraction "1-n". The array is configured to be optically connected with a detector and the first and second regions are physically separated in wells. Claim 258 recites ridge features for separating the regions as opposed to wells. The Examiner did not find prior art which teaches or suggests the combination of steps in the method. The Examiner considers Lewis et al. (5,571,401) to be the closest prior art. Lewis teaches a sensor array having regions of two mixed elements, but does not teach nor suggest the relative concentrations used in the instant method. Lewis also does not teach the separation of the regions by physical elements.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
